Dementia patients in acute care facilities

**Resources searched**

Cochrane Library, BNI, Cinahl, TRIP, NHS Evidence mental Health Specialist Collection and Later Life Collection, NHS guidance,

**Database search terms**: dementia, dementia nursing, acute care, hospital care, quality, dignity

**Google search string**: dementia care (acute or hospital) quality

**Summary**

2 new reports found and a range of journal articles (limited 2005 – 2010).

**Guidelines**

"Royal College of Physicians interim report: national audit of dementia care in general hospitals".

December 2010.

Improveing quality of care for people with dementia in general hospitals - 2010 RCN publication.

Who cares wins: improving the outcome for older people admitted to the general hospital – 2005 - Royal College of Psychiatrists

**Evidence-based reviews**
Published research

1. Developing champions to enhance the care of people with dementia in general hospitals.

Author(s): Crabtree, J, Mack, J

Citation: Nursing Times, December 2010, vol./is. 106/48(13-4), 0954-7762 (2010 7 Dec)

Publication Date: December 2010

Abstract: Development and implementation of a nurse-led dementia champions programme in general community hospitals in Scotland. The role of a dementia champion is explained and the aims, content and organisation of the programme are described. An evaluation by champions, mentors and charge nurses in the hospital is summarised. 8 refs.

2. Learning from each other to improve dementia care.

Author(s): Mashta, O

Citation: Nursing Standard, September 2010, vol./is. 25/3(18-9), 0029-6570 (2010 22 Sep)

Publication Date: September 2010

Abstract: Nurses who undertook a facilitators’ course describe the development of dementia-specific education for HCAs at the Royal Free Hospital, London. Designed to run for 6 months and to accommodate different shifts, the educational initiative raises awareness of the care needs of patients who have dementia and encourages discussion of potentially challenging scenarios as well as a reflective approach.

4. The care of older people with dementia in acute hospitals.

Author(s): Cowdell, F

Citation: Int J Older People Nursing, June 2010, vol./is. 5/2(83-92), 1748-3735 (2010 Jun)

Publication Date: June 2010

Abstract: Research in the UK into experiences of nurses and patients regarding care received by older people with dementia in acute hospitals. Participant observation and interviews were conducted to explore patients' perceptions of their care and the ward environment, fears and anxieties and interactions with staff. Nurses' values and philosophy of dementia care and confidence in providing care were also examined. 69 refs.

5. Care of older people with dementia in an acute hospital setting.

Author(s): Cowdell F

Citation: Nursing Standard, 10 February 2010, vol./is. 24/23(42-48), 00296570

Publication Date: 10 February 2010

Abstract: Aim To investigate the experiences of patients and nursing staff in relation to the care delivered to, and received by, older people with dementia in an acute hospital setting. Method An ethnographic approach was used. Data were collected through observation and interviews involving patients and nursing staff. Findings Care for older people with dementia in acute hospital settings is not always satisfactory. Generally, people with dementia find the delivery of care and the experience of being in hospital distressing. Nurses strive to provide optimum care, but this is not always achievable. Sub-optimal care can be explained by considering the effect of empathy and Bourdieu's theory of practice. Conclusion There is a need to improve current practice when caring for older people with dementia. Approaches to education and practice development need to engage nurses in
both cognitive and affective domains, so that nurses gain knowledge and an understanding of patients' feelings and experiences.

11. Maintaining privacy and dignity of patients admitted to a district general hospital NHS trust.

**Author(s):** Haak N

**Citation:** Developing Practice Improving Care, 01 March 2009, vol./is. 5/2(1-4), 14784106

**Publication Date:** 01 March 2009

**Abstract:** Concerns about the lack of privacy and dignity that older people with dementia in an acute orthopaedic unit were receiving led to a project that has enabled staff to increase their understanding and knowledge of patients with dementia and how to meet their needs. The project involved workshop days to raise staff awareness and understanding of how to maintain dignity when caring for patients with dementia; the development of a designated six bedded bay for female trauma patients with dementia and the creation of a working group to facilitate ongoing developments in care. Evaluation feedback from both staff and relatives has been positive. Staff report that their knowledge and understanding of dementia has improved and as a result, the care they are giving has changed with more emphasis on taking time and listening to the patients’ needs and wants. Relatives feel that the atmosphere created by the designated bay has a positive impact on patients’ experience of care.
12. Maintaining privacy and dignity of patients admitted to a District General Hospital NHS Trust.

Author(s): Haak, N

Citation: Foundation Nursing Studies Dissemination Series, 2009, vol./is. 5/2(1-4), 1478-4106 (2009)

17. Mental health. Caring for people with dementia in the acute setting: study of nurses' views.

Author(s): Nolan L

Citation: British Journal of Nursing (BJN), 12 April 2007, vol./is. 16/7(419-422), 09660461

Publication Date: 12 April 2007

Abstract: Caring for people with dementia in an acute hospital setting presents a number of challenges. This article reports the findings of a study which explored nurses' experiences of caring for older people with dementia in a unit caring for older people within an acute hospital. The study used a thematic approach to produce an interpretation of the care experience and a purposive sample of seven nurses was interviewed regarding the research aims. The findings revealed the structural inadequacies of the acute hospital as a dementia care environment and the resultant challenges and complexities of the care experience. Despite the identified challenges, nurses considered the specific needs of people with dementia and the environmental effects of the acute setting on their ability to meet identified needs.

20. **The effect of a disease management intervention on quality and outcomes of dementia care: a randomized, controlled trial.**

**Author(s):** Vickrey BG, Mittman BS, Connor KI, Pearson ML, Della Penna RD, Ganiats TG, DeMonte RW Jr., Chodosh J, Cui X, Vassar S, Duan N, Lee M

**Citation:** Annals of Internal Medicine, 21 November 2006, vol./is. 145/10(713-), 00034819

**Publication Date:** 21 November 2006

**Abstract:** BACKGROUND: Adherence to dementia guidelines is poor despite evidence that some guideline recommendations can improve symptoms and delay institutionalization of patients. OBJECTIVE: To test
the effectiveness of a dementia guideline-based disease management program on quality of care and outcomes for patients with dementia. 

**DESIGN:** Clinic-level, cluster randomized, controlled trial. **SETTING:** 3 health care organizations collaborating with 3 community agencies in southern California. **PARTICIPANTS:** 18 primary care clinics and 408 patients with dementia age 65 years or older paired with 408 informal caregivers. **INTERVENTION:** Disease management program led by care managers and provided to 238 patient-caregiver pairs at 9 intervention clinics for more than 12 months. **MEASUREMENTS:** Adherence to 23 guideline recommendations (primary outcome) and receipt of community resources and patient and caregiver health and quality-of-care measures (secondary outcomes). **RESULTS:** The mean percentage of per-patient guideline recommendations to which care was adherent was significantly higher in the intervention group than in the usual care group (63.9% vs. 32.9%, respectively; adjusted difference, 30.1% [95% CI, 25.2% to 34.9%]; \( P < 0.001 \)). Participants who received the intervention had higher care quality on 21 of 23 guidelines (\( P < \text{or} = 0.013 \) for all), and higher proportions received community agency assistance (\( P < \text{or} = 0.03 \)) than those who received usual care. Patient health-related quality of life, overall quality of patient care, caregiving quality, social support, and level of unmet caregiving assistance needs were better for participants in the intervention group than for those in the usual care group (\( P < 0.05 \) for all). Caregiver health-related quality of life did not differ between the 2 groups. **LIMITATIONS:** Participants were well-educated, were predominantly white, had a usual source of care, and were not institutionalized. Generalizability to other patients and geographic regions is unknown. Also, costs of a care management program under fee-for-service reimbursement may impede adoption. **CONCLUSIONS:** A dementia guideline-based disease management program led to substantial improvements in quality of care for patients with dementia.

22. Health professionals' perspectives of providing care to people with dementia in the acute setting: toward better practice.

Author(s): Borbasi S, Jones J, Lockwood C, Emden C

Citation: Geriatric Nursing, 01 September 2006, vol./is. 27/5(300-308), 01974572

Publication Date: 01 September 2006

Abstract: This article reports an interpretative research project about the care of patients with dementia admitted to the acute setting with a non-dementia-related illness. Open-ended interviews were conducted with 25 medical, nursing, and other health care professionals drawn from 3 metropolitan teaching hospitals in Australia. Qualitative data analysis generated 5 major themes relating to the built environment and organizational "system" as determinants of practice, the influence of key players, current dementia care management, and ideal dementia care management. Results showed acute care hospitals are not the best place for people with dementia and can negatively influence health outcomes such as functional independence and quality of life. Participants reported attempts to provide best practice but experienced major constraints stemming largely from environmental, sociocultural, and economic issues. Recommendations include the delivery of acute services in tandem with dementia services and a whole organization shift in thinking away from what conveniently suits the institution to thinking that is person-centered and dementia-friendly. With support from executive-level management, nurses can play a leading role in the implementation of practice change.

Source: CINAHL

23. Observations of the experiences of people with dementia on general hospital wards.

Author(s): Norman R

Citation: Journal of Research in Nursing, 01 September 2006, vol./is.
Abstract: This paper is based on research that aimed to explore how people with dementia are cared for in general hospital wards in the United Kingdom (UK). The paper details findings from one phase of data collection, ward based observations. The observations elucidated the ways in which persons with dementia express and portray their 'selves', the interpretations made by nurses about the patients with dementia they cared for and the constructions of roles and care environments. The findings demonstrate how a variety of influences affect the way a person with dementia experiences a hospital admission. Nurses' positive or negative interpretations of a person with dementia can lead to the 'constraint' or 'realisation' of a person's portrayal of self. In an ageing global society, improving the care of older people is a priority. The findings illuminate the central importance of promoting two-way relationships in which the actions of people with dementia are recognised as portraying individuality and identity. The study highlights a need for practice development to enhance nursing care for medical and surgical patients with a coincidental diagnosis of dementia.

25. **Meeting the nutritional needs of patients with dementia in hospital... third article in a series of five.**

**Author(s):** Archibald C

**Citation:** Nursing Standard, 19 July 2006, vol./is. 20/45(41-45), 00296570

**Publication Date:** 19 July 2006

**Abstract:** This is the third article in a series of five focusing on the needs of patients with dementia. It emphasises the importance of good nutritional intake for patients with dementia in hospital care. On busy wards, nutrition is often overlooked in favour of other aspects of care. Nurses' increased knowledge about dementia, assessment of nutritional needs, and personal capabilities can improve patients' experiences and outcomes. Excess dependency and emotional aspects of food refusal are also discussed.
